

SP Forms

Web app idea

By: Kalivaradhan Aadharsh

Date: 25/10/2025

Project Description:

The project aims to build a custom forms app called "SP Forms" custom built for the needs of SP. SP currently uses either google forms or microsoft forms with no standardization between departments. This could lead to issues or misinterpretation of form details made by other departments.

Project Solution:

SP Forms will be a web based app built with react and a node JS backend. The apps core authentication system will be powered by Orion. The app will allow only account creations from certain email domains and is an SP only application. The application registers users by getting their student email and student id number. Once complete they can access any form given and the upon submission their student particulars will be tagged with the form response otherwise exclusively set to anonymous. A form can be created by anyone. Staff of SP have access to an organization templates directory where a premade template of standard form schemas is stored (created by SPs own team). The relative department can then just import the template and modify it to their needs and publish the form, this allows standardization across all departments and prevents legal issues. For time saving the app also has an AI based form builder that with a prompt can build the form and add its relative validation rules to the schema.

About Orion:

The main reason for this app is to load test Orion, The authentication system. This will provide me with real world data about how orion handles large loads and scaling. This is a prelaunch live load test for orion and will be dealt with like a real production application. Feedback and relative telemetry data gained will be used to optimize and improve orion before it s public debut.
